TAKEHOME ASSIGNMENT (30 MARKS)

Active Directory is a directory service developed by Microsoft for managing **Windows domain networks**. It enables administrators to manage **users, groups, computers, and other network resources** by providing a **centralized system to store information** and control access to them.

Scenario

You are tasked with **designing and implementing** an Active Directory domain structure for a new company with the following specifications:

- The company operates in **three locations: Kenya, Tanzania, and Uganda**.
- Each location is organized into three **functions: Finance, Operations, and Human Resources**.
- **Each function** will have its **own domain** to manage resources independently.
- A **forest root domain** is required for centralized control, along with a **child domain** for managing **corporate resources** shared across locations.

Required:

- 1) Use a reliable computer, either directly or by setting up a **virtual machine**, to install the Windows Server software of your choice. [5 Marks]
- 2) Create a **logical domain structure** that meets the company's needs. [5 Marks]
- 3) Provide a **step-by-step installation guide** covering the creation of domains, objects, trees, and the forest. Provide screenshots. [10 Marks]
- 4) **System administrators** must be able to use **remote access** to join new devices to the domain, even if they are not physically present at the machine's location. [5 Marks]
- 5) **Log monitoring** is essential for security. As a **security analyst**, set up the system in a way that enables you to review **application server logs** and investigate **suspicious user accounts** remotely, without needing to be on-site. [5 Marks]
